

AMERICAN INTERNATIONAL UNIVERSITY-BANGLADESH

Faculty of Science and Technology
Department of Computer Science
CSC 3215: Web Technologies

Semester: Summer 2025-26

Group No: 04

Section: O

Group Members:

SL.	Student ID	Name	Role	Signature
1	23-50174-1	Emon Biswas	Group Leader	
2	23-50114-1	SM Fahim Shahriar	Member	
3	23-50177-1	Iftekhhar Ahmed	Member	
4	23-51327-1	Umara Rashid	Member	

Project Title

Task & Project Management System

Short Description

We are developing a Web based Task & Project Management System for small software or creative teams to plan, assign and monitor work in a single place. The platform has four types of roles: Members are assigned to tasks, log time and comment; Team Leads create projects, define tasks and milestones, and track the delivery of the project to the client; Client has read-only access to projects created for them and can be seen in comments and feedback/milestone approvals; Admins have access to the workspace, user accounts, and platform usage reports. It is implemented using the PHP/MySQL/MVC architecture, prepared statements for all access to the database, role-based access control based on sessions, and AJAX (for live task status updates and real-time user search) to ensure that each role is only allowed to see the tools that are relevant to that role.

Introduction

The problem isn't that there's not enough work to be done when creating a student or small team project; it's that there's not enough visibility on who is doing what, when and how. Task lists inhabit disjointed chat threads, spreadsheets, and verbal updates and deadlines sneak up on the side without anyone realizing they've passed. Tools like Trello, Asana or Jira do help to solve some parts of this problem for the internal team, but they're not built to the extent of strict client roles which can view progress and leave feedback without accessing the underpinning tasks nor to the type of access control we need to create for this course using workspaces and role separation.

We overcome this in our Task & Project Management System by structuring work into workspaces, projects, milestones and tasks, and allowing only actions that are specific to each user's role. A Member has their own Kanban board of assigned tasks, and can change the status, record hours and comment on their work without ever having to interact with another Member's work. A Team Lead can manage a project from its inception, from making tasks and assigning them to team members, to setting milestones and reviewing the work and progress of his team at a single glance. A Client can purposely disable any access to edit anything, but watch milestones move from Pending to Compliant, view a filtered activity feed, and submit feedback to approve or request revisions and close the communication loop without relinquishing control of the task board. All of this is overseen by an Admin who can control workspaces, accounts and the overall usage of the platform. The result is a single system, with four widely different users having exactly the view and level of control they need, built on a PHP/MySQL stack, with a focus on the MVC pattern, prepared statements, session-based authentication and AJAX-driven interactions as required for this course.

Background Study

Task management and project management software are no longer just about to-do lists, they've become full workflow software. Our task board is based on the kanban approach to work, popularised by software such as Trello, where tasks are represented as cards flowing from To Do to In Progress to Done. Asana, Jira, and Monday.com are more advanced platforms that add such features as assignees, priorities, due dates, and time tracking on top of this board—these are the features that we modelled our tasks table on: priority levels, estimated hours, statuses, and optional links to milestones.

The problem for general purpose tools with agency assignments or client-facing projects is the separation of roles: A client who has paid for a project should not be able to edit their task, view internal team discussion, or re-order their cards, but they should still be able to see progress and provide feedback. Our system adds this restriction directly to the database and to the controllers: internal comments are marked as such and hidden from clients; milestones are only visible to clients if they explicitly set it to that; the client's task board is not visible to them even if they don't mark it as such, it is actually read-only at the controller level. It's the same as normal role-based access control (RBAC) – each protected function is evaluated against the logged in user's role and if granted, it may execute.

The project also follows the standard three-tier web architecture: a separation of data (Models), presentation (Views), and request handling (Controllers), which allows the business logic to be removed from the pages that users view and simplifies the development of the codebase by four group members working on it simultaneously. Last but not least, the AJAX-y interactions (a live task-status update and an admin's live user search) demonstrate the modern trend of small, asynchronous, JSON-based exchanges between the browser and the PHP-based back-end, even though there is no JavaScript framework in use.

Types of Users:

- **Members**
- **Team Lead**
- **Client**
- **Admin**

Common Features (Available to All Users)

- **Authentication**
 1. Login to the system
 2. Logout from the system
 3. User registration
- **Account Management**
 1. Change password
 2. View and edit profile information (name, phone, company)
 3. Upload or update profile picture
- **Dashboard**
 1. Access a personalized dashboard after login
 2. View summary statistics relevant to their role
 3. Navigate to key features via quick-action links

Specific Features by User Type

- **Features of Member**
 1. **Task Management**
 1. View tasks assigned to them
 2. Update task status in real time (To Do / In Progress / Review / Done)
 3. Log hours worked on a task
 2. **Task Collaboration**
 1. Add comments on an assigned task
 2. View task discussion / comments
 3. Upload file attachments to a task
 3. **Personal Productivity**
 1. View personal task progress
 2. Track completed tasks and total logged hours
 3. View a productivity summary
- **Features of Team Lead**
 1. **Project Management**
 1. Create a new project within a workspace
 2. Edit project details
 3. Set project deadline and client visibility
 2. **Task Assignment**
 1. Create project tasks
 2. Assign tasks to project members

3. Set task priority, status, and due date

3. Team & Milestone Management

1. Assign or remove members on a project
2. Create milestones and mark them completed
3. Monitor member workload and project progress

4. Delivery & Reporting

1. Track project status (planning → active → completed → archived)
2. Control client visibility of milestones and projects
3. Review project reports, time logs, and burndown summaries

• Features of Client

1. Read-Only Project Visibility

1. View progress of projects they are attached to
2. View a filtered activity feed for their projects
3. View a client-visible task board, filterable by project

2. Milestone Feedback & Approval

1. View milestone details
2. Submit feedback approving a milestone or requesting revision
3. Track milestone approval status

3. Comments & Files

1. View non-internal comments on tasks
2. View client-visible file attachments
3. Browse comments and files by project

• Features of Admin

1. Workspace Oversight

1. View and manage all workspaces on the platform
2. Activate or deactivate a workspace
3. Assign users to a workspace or remove them

2. User Account Management

1. Create user accounts for any role
2. Search and filter users in real time
3. Change user roles and account status (active / inactive)

3. Platform Reports

1. View platform-wide usage statistics
2. View all projects and tasks across every workspace
3. Review recent platform activity logs
